

Australian Car Prices Dashboard

Portfolio case study · Power BI (DAX + Power Query) · ~16.7k listings

TOTAL LISTINGS
17K

AVG PRICE
\$37.30K

MEDIAN PRICE
\$29.50K

Problem

- Build an interactive dashboard to understand typical car prices in Australia and how price changes by brand, year and kilometres.
- Make it usable for quick scanning (KPIs + filters) and deeper exploration (drivers + outliers).

What I built

- KPIs: Total Listings, Avg Price, Median Price
- Slicers: State, Year, Brand
- Visuals: Avg Price by Brand (Top 10), Median Price by Year, Price vs Kilometres (scatter)

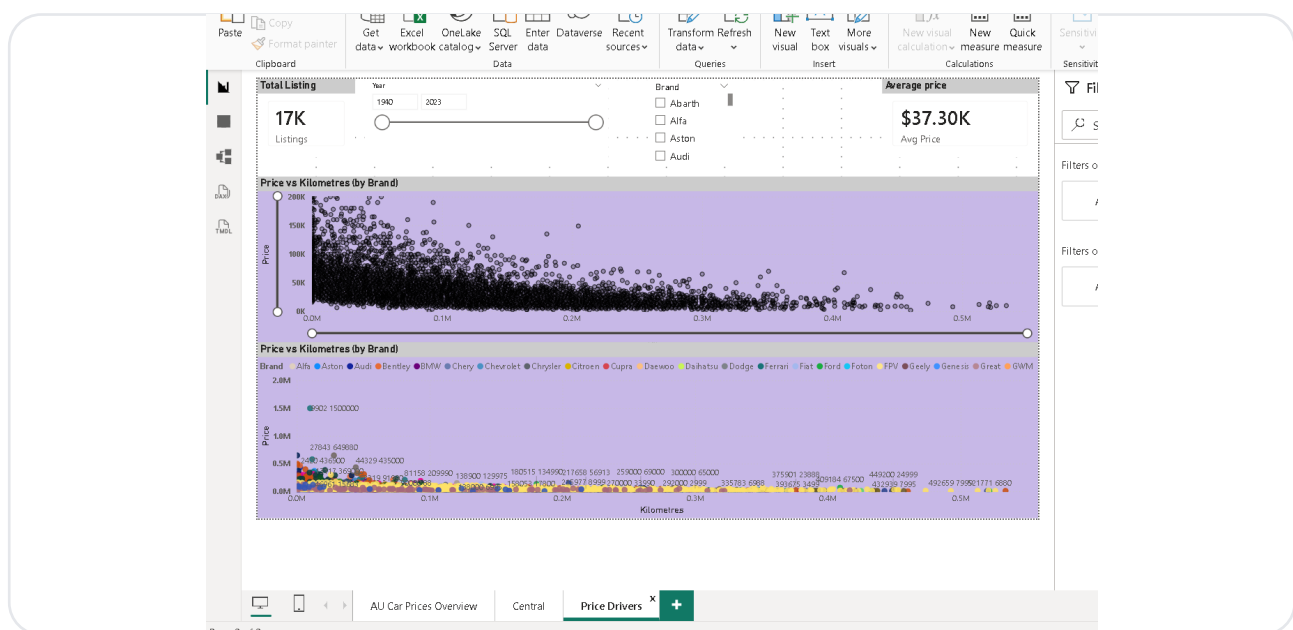

Figure 1. Overview page (KPIs + state split + avg price by brand)

Insights and recommendations

Numbers pulled from the dashboard views shown below

Key insights

- Luxury brands dominate the top end: Lamborghini avg price $\approx$ 0.54M (~\$540k) in the Top 10 view.
- Older-year spikes can be misleading: 1960 shows median $\approx$ 1.50M, likely due to very low listings/outliers.
- Kilometres alone doesn't explain price: example points 5,595 km = \$51,990 vs 18,300 km = \$199,900.

So what (actions)

- Use Brand/Year filters (or a price cap) to switch between luxury and mainstream market views.
- Focus year trend analysis on recent years using the Year slicer; treat very old years as niche/low-sample segments.
- Compare Brand+Model+Year first, then use kilometres as a second check (value check), not the only decision factor.
